Combine last two local commits

I committed locally but haven't pushed yet. I want to combine the last two commits into a single commit with a new message."

Two quick, safe ways to combine the last two local commits into one with a new message.

Method 1 — interactive rebase (recommended)

1. Start the interactive rebase: git rebase -i HEAD~2
2. In the editor that opens you'll see the two commits listed (oldest first). Change the file so the first line is `pick` and the second is `squash` (or `s`), for example: pick <old-sha> Old commit message squash <new-sha> Newer commit message
3. Save & close. Git will open an editor to let you edit the combined commit message. Replace the messages with your new message, save & ↓ se.
4. Done. If anything goes wrong, run: git rebase --abort
